**Re:** Import Soil Evaluation, Use of Soil Source P as Import to Parcel C, Boeing Realty Corporation,  
Former C-6 Facility – Parcel C, Los Angeles, California

Haley & Aldrich, Inc. is herein providing this technical memorandum to summarize our recommendations regarding the use of an identified potential soil source, herein referred to as Source P, as import to Parcel C of the Boeing Realty Corporation's (BRC's) Former C-6 Facility in Los Angeles, California (subject parcel). Based on our review of the environmental information provided for the Source P import soil, this soil may be used as fill soil on Parcel C.

**OVERVIEW/PURPOSE**

A source of soil, totaling up to approximately 120,000 cubic yards, has been identified as potential import soil for use on Parcel C. Kennedy Jenks Consultants (K/J) collected twelve soil samples from Source P and tested these samples in accordance with the protocol presented in the December 11, 2000 Import Soil Screening Program Plan prepared for Parcel C. This plan has been used as guidance to evaluate import soil from "offsite" sources. The criteria presented in the plan were then compared to the analytical results of the soil samples. The purpose of this technical memorandum is to present a summary of the evaluation of the Source P soil and to provide recommendations for use as import for Parcel C.

**LOCATION OF PROPOSED SOURCE P IMPORT SOIL**

The Source P potential import soil comprises approximately 120,000 cubic yards. Source P soil is located at 10270 Constellation Boulevard in Los Angeles, California. This soil will be excavated from beneath an existing parking lot, referred to as the Constellation Place Parking Lot. This property has historically been used as a parking lot and movie studio, and formerly contained movie stage construction shops.

## COMPARISON OF ANALYTICAL RESULTS TO IMPORT SOIL GUIDANCE CRITERIA

The laboratory report for the soil samples collected from the subject potential source is presented as Attachment 1. Each sample was tested for metals, and various organic chemicals, including total petroleum hydrocarbons (TPH), polynuclear aromatic hydrocarbons (PAH), and volatile organic compounds (VOCs). A review of the laboratory results indicates that the organic chemical results are within the site-specific import soil evaluation criteria presented in the December 11, 2000 Import Soil Screening Program Plan. A summary of the detected organic compounds and their associated site-specific soil import criteria are presented in Table 1. The remaining organic compounds on the analyte list were not detected, and their detection limits are consistent with the soil import criteria.

**Table 1. Summary of Detected Organic Results and Associated Site-Specific Import Soil Criteria**

Several of the metals results are greater than the site-specific criteria, but are within the reported southern California background literature value criteria. Others metals results are greater than the reported southern California background literature value criteria, and are identified in bold in Table 2. A summary of these metals results is presented in Table 2. The remaining metals on the analyte list are consistent with the import soil criteria.

## RECOMMENDATIONS FOR USE AS IMPORT SOIL

It is recommended that the subject approximately 120,000 cubic yards of soils comprising Source P be used as fill soil on Parcel C. The reported soil concentrations for organic compounds are consistent with the site-specific criteria, and those for inorganic chemicals are consistent with the site-specific and/or southern California background criteria, with the exception of molybdenum, cadmium, chromium, and nickel. The relatively narrow range of molybdenum, cadmium, and nickel concentrations for the samples tested suggest that they are representative of background metals concentrations for the general geographic region from which these soils originated. In addition, the property from which the Source P soils originated has not been used for industrial activities, the samples were collected from various depths and no chemical concentration "hot spots" were identified, and no other typical indicators of contamination were present in any of the samples. Thus, the chromium concentration above the southern California background criterion is not considered to be a result of chemical contamination. Further, the reported range of molybdenum results are consistent with sample results collected from other apparently non-impacted potential soil sources identified in Los Angeles, California during the search for acceptable import soil for Parcel C.

### Definition of Terms :

R1	Results Of First Analysis
SP	Spike Concentration Added to Sample
MS	Matrix Spike Results
MSD	Matrix Spike Duplicate Results
PR1	Percent Recovery Of MS: $\{(MS-R1) / SP\} \times 100$
PR2	Percent Recovery Of MSD: $\{(MSD-R1) / SP\} \times 100$
RPD	Relative Percent Difference: $\{(MS-MSD) / (MS+MSD)\} \times 100 \times 2$
